# Peptide-Hypervalent Iodine Reagent Chimeras: Enabling Peptide Functionalization and Macrocyclization** 

Xing-Yu Liu, Xinjian Ji, Christian Heinis, and Jerome Waser*

#### Abstract

Herein, we report a novel strategy for the modification of peptides based on the introduction of highly reactive hypervalent iodine reagents-ethynylbenziodoxolones (EBXs) - onto peptides. These pep-tide-EBXs can be readily accessed, by both solutionand solid-phase peptide synthesis (SPPS). They can be used to couple the peptide to other peptides or a protein through reaction with Cys, leading to thioalkynes in organic solvents and hypervalent iodine adducts in water buffer. Furthermore, a photocatalytic decarboxylative coupling to the C-terminus of peptides was developed using an organic dye and was also successful in an intramolecular fashion, leading to macrocyclic peptides with unprecedented crosslinking. A rigid linear aryl alkyne linker was essential to achieve high affinity for Keap1 at the Nrf2 binding site with potential proteinprotein interaction inhibition.

## Introduction

Over the past two decades, the importance of peptides in drug discovery has continuously grown, with over 60 peptide drugs approved until 2018. ${ }^{[1]}$ As compared with smallmolecule drugs and larger biological compounds, peptides occupy a unique intermediate position in chemical space, leading to different therapeutic applications. Nevertheless, unmodified natural peptides are poor drug candidates owing to their low bioavailability and fast degradation by proteolytic enzymes, which put them at a disadvantage when compared to small organic molecules or larger biologicals.

[^0]To improve their bioactivity and stability, N and/or C-terminal protection, macrocyclization ${ }^{[2]}$ and other selective modifications ${ }^{[3]}$ introducing non-natural motifs into the targeted peptides have been developed (Scheme 1a). In this regard, hypervalent iodine reagents (HIRs) have been recognized as valuable and versatile reagents for peptide functionalization owing to their low toxicity, high reactivity and good functional-group selectivity. ${ }^{[4]}$ They enable the transfer of various electrophiles onto different amino acid residues in peptides or proteins. Among these HIRs, ethynylbenziodoxolones (EBXs) are of particular interest. ${ }^{[5]}$ Nucleophilic amino acid residues or radical species generated under photoredox conditions can be trapped by EBXs to form alkynylation products (Scheme 1a). ${ }^{[6]}$ The introduction of an alkyne can not only provide an extra reactive site for further modifications, ${ }^{[7]}$ but also constitutes a unique rigid linker with very low steric demand ${ }^{[8]}$ Despite these elegant advances, each new transformation required the design of specific reagents and conditions, leading to tedious and time-consuming optimization. Many reagents also have insufficient solubility in water, or display diminished reactivity when modified with water solubilizing groups. In addition, whereas progress has been made in the selective functionalization of one amino acid over others, chemical functionalization methods usually do not allow selectivity among different sites containing the same residue.

To enable complete site selectivity, another strategy is usually followed: the installation of non-natural functionalities into peptides and proteins, enabling "bioorthogonal" reactions that proceed exclusively at the modified site. ${ }^{[9]}$ The use of cycloaddition reactions, in particular between azides and alkynes, has been most often exploited in the past, but new types of bioorthogonal reactions proceeding with high rates under mild conditions, especially in the absence of metal catalysts, are still urgently needed. Owing to their unique reactivity, the introduction of HIRs into peptides and proteins appears highly attractive in this context (Scheme 1b). Nevertheless, the modification of hypervalent iodine reagents without touching the highly reactive iodine center is difficult and has been achieved only on small organic molecules so far. ${ }^{[10]}$ The only successful approach was reported by our group in 2019 and 2022. ${ }^{[11]}$ Vinylbenziodoxolone (VBX) products were formed through the addition of Cys/Tyr-containing peptides/proteins to EBXs. The VBXs could undergo bioorthogonal Suzuki coupling reactions to introduce aryl substituents onto peptides and proteins. However, high Pd catalyst loading and tedious optimization are necessary for this cross-coupling, which therefore fails to meet the requirements for a "click

Scheme 1. Peptide modifications enabled by hypervalent iodine reagents (HIRs). a) Chemical modifications of bioactive peptides: Recent progress using alkynylation with ethynylbenziodoxolones (EBXs). b) Using hypervalent iodine reagents for bioorthogonal reactions on peptides: Limited single precedence and new reagent design. c) Metal-free bioorthogonal transformations with the new Peptide-EBX reagents.
reaction" ${ }^{[12]}$ In fact, VBXs reagents are far less reactive than EBXs, and only a few transformations are possible, whereas hundreds of reactions under mild conditions are known for EBXs. ${ }^{[5]}$ If a method could be found to install EBXs onto peptides/proteins, this would therefore open the door to a broad range of new bioorthogonal transformations.

Herein, we show that a bifunctional EBX reagent containing two electrophilic sites: the alkynyl benziodoxolone (BX) and an activated pentafluorophenyl (PFP) ester, can undergo selective amide bond formation at the N terminus or a Lys side chain with the PFP ester, forming peptide-EBX reagents (Scheme 1b). This transformation was possible both in solution and on solid phase, the latter allowing straightforward purification. Using these reagents, two transformations proceeding in the absence of a transition-metal catalyst were investigated. First, fast and selective S-alkynylation and -alkenylation with Cys-containing peptides and proteins were developed, a simple solvent switch allowing the outcome of the reaction to be changed (Scheme 1c). These transformations could also be accomplished in one pot, without purification of the EBX reagents.

Second, a visible-light-mediated C-terminal decarboxylative alkynylation of peptides catalyzed by organic dyes was implemented. In the absence of a reaction partner, if the peptide bearing the EBX reagent had a free C-terminus, a new type of macrocyclization occurred, resulting in unprecedented macrocycles incorporating the rigid alkyne unit. The method was used to develop new potential inhibitors of the Keap1-Nrf2 protein-protein interaction. The rigidity of the aryl alkyne linker was important to achieve efficient binding to Keap1, as reduction of the triple bond led to a 5.5 -fold decrease in binding affinity.

## Results and Discussion

## Synthesis of Peptide-EBXs

Recently, our group developed a novel bifunctional EBX reagent $\mathbf{1 a}$ for Lys-Cys peptide stapling. ${ }^{[13]}$ In this case, thiol attack onto EBXs occurs first, followed by proximity-driven amide bond formation on the pentafluorophenyl (PFP)
ester. Considering the low abundance of Cys in biomolecules, we wondered if a direct reaction between Lys or the N -terminus could be developed in the absence of free thiols to introduce the highly reactive EBX core into biomolecules. As a model reaction, we first examined selective amide formation of bifunctional EBX 1a with benzyl amine (2a; Scheme 2 a ). We were pleased to see that the desired product 3a was formed, albeit with a small amount of undesired OVBX product 4 a generated through the addition of PFP to
the triple bond. ${ }^{[14]}$ To diminish the electrophilicity of $\mathbf{1 a}$, we synthesized modified bifunctional reagent 1b containing one $\mathrm{CH}_{2}$ between the EBX core and the activated ester. Indeed, no O-VBX product 4b was formed, but amide bond formation was still efficient. We then examined the reaction on pentapeptides, focusing first on the more accessible Lys side chain in the presence of the protected N -terminus (Scheme 2b). Peptide-EBXs 3c-g bearing only aliphatic residues were isolated in $24-50 \%$ yield. The reactions were

Scheme 2. Synthesis of peptide-EBXs. a) Model studies. b) Synthesis of peptide-EBXs in solution. c) Synthesis of peptide-EBXs on solid phase. Yields of isolated products are given. Full experimental details are provided in the Supporting Information. HPLC and MS data can be found in Figures S1-S66 and Tables S1-S30.
nearly quantitative after only 20 min in open flasks, and mass loss occurred owing to the instability of EBX cores on reverse-phase HPLC. Importantly, the reaction was selective for Lys in the presence of nucleophilic amide ( $\mathbf{3 h}$ and $\mathbf{3 i}$ ) or aromatic ( $\mathbf{3} \mathbf{j}-\mathbf{I}$ ) residues. We then examined the potentially more challenging functionalization of the N -terminus. Gratifyingly, peptide-EBXs $\mathbf{3 n - p}$ with a free $N$-terminal Phe group residue were obtained in comparable yield, even in the presence of unprotected Ser ( $\mathbf{3 n}$ ) or protected Lys ( $\mathbf{3 0}$ ). The Lys side chain could also be functionalized on larger peptides, leading to $\mathbf{3 q}$ and $\mathbf{3 r}$ with 9 and 10 amino acids, respectively. Although the synthesis of peptide-EBXs in solution was successful, a disadvantage was the significant mass loss upon HPLC purification. This was mostly due to partial degradation of the compound on HPLC. For example, when 10 mg pure compound $\mathbf{3 g}$ were submitted to HPLC, only 6.8 mg could be recovered. Therefore, we investigated if the reagent could be synthesized directly on a solid phase (Scheme 2c). In fact, peptide-EBX 3s functionalized on the N -terminus could be obtained on solid phase with high purity (HPLC trace of $\mathbf{3 s}$ and $\mathbf{3 u}$ in Scheme 2c) in $19 \%$ over 14 steps from commercial building blocks. Moreover, we could introduce the EBX core selectively on the Nterminus ( $\mathbf{3 t}$ ) in the presence of Boc-protected Lys during solid-phase synthesis, and the acidic stability of the EBX core allowed us to cleave the resin and Lys protecting group using TFA. The protecting group on other side chains, such as Glu, Thr and Asp, can be also removed efficiently without influencing the overall yield ( $\mathbf{3 u}$ ). By using a well-established orthogonal protecting group on Lys, ${ }^{[15]}$ peptide-EBXs $\mathbf{3 v}$ and $\mathbf{3 q}$ were accessed in $34 \%$ over 10 steps and $11 \%$ over 22 steps, respectively.

## Intermolecular Reactions with Peptide-EBXs and Product Modification

After establishing the synthesis of peptide-EBXs, we explored their application in different reactions. Among the most robust reactions for EBX reagents are the alkynylation ${ }^{[16]}$ and alkenylation ${ }^{[11 b]}$ of thiols (Scheme 3a). In an organic solvent, protected Cys was incorporated efficiently (HPLC/UV trace of 5a after reaction in Scheme 3a) to give thioalkynes 5a-d. Alternatively, 5a could also be obtained in $34 \%$ yield in a one-pot procedure from peptide $\mathbf{2 c}$ without isolation of the peptide-EBX. One-pot amidation with $\mathbf{1 b}$ followed by reaction with protected Cys gave 5 a in $34 \%$ yield. Nucleophilic aromatic amino acids, such as His, Tyr and Trp, were well tolerated ( $\mathbf{5 b} \mathbf{b} \mathbf{d}$ ). Glutathione could also be incorporated efficiently, either on Lys (peptide 5e) or on the N terminus (peptide $\mathbf{5 f}$ ). In aqueous media, alkenylation of peptide-EBXs occurred by simple addition of the thiol to generate S-VBX products $\mathbf{6 b}$ (HPLC/UV trace of $\mathbf{6 a}$ after reaction in Scheme 3a). These physiological conditions can also be used for protein functionalization. As proof of concept, $\mathrm{His}_{6}$-Cys-Ubiquitin was examined as a substrate. A quantitative reaction was observed, although in this case a 1.4:1 mixture of VBX $\mathbf{6 b}$ and thioalkyne $\mathbf{5 g}$ was observed.

As a second transformation, we investigated C-terminal decarboxylative alkynylation using photoredox catalysis with visible light and the organic dye 4CzIPN (Scheme 3b). ${ }^{[6 d]}$ We selected dipeptide Cbz-GP-OH (7) as the coupling partner, as the decarboxylation is faster on proline as compared to other C-terminal amino acids. Decarboxylative alkynylation occurred on Lys-modified peptide-EBXs 3 to give products 8a-c bearing a Gly (HPLC/UV trace of 8a after reaction in Scheme 3b), a Pro and a Glu C-terminal amino acid respectively (Scheme 3b). As expected, the yield was lower for $\mathbf{8 b}$ due to the competition with the C-terminal proline of $\mathbf{3 g}$. In addition, decarboxylative alkynylation was also successful in N terminal modified EBX reagent $\mathbf{3 p}$ to give alkyne $\mathbf{8 d}$ in 49 \% yield.

To enhance the practicability of the functionalization reactions, we then performed them directly on solid phase (Scheme 4a). To our delight, the resin-bound peptide-EBXs reacted efficiently with protected Cys to give S-alkynylation products 5h and 5i (HPLC/UV trace in Scheme 4a) in excellent overall yields. Interestingly, for peptide sequences FLEEV and FLAFF, by switching the resin cleavage conditions from HFIP/DCM to more acidic TFA/TIPS/ $\mathrm{H}_{2} \mathrm{O}$, we could at the same time remove the protecting groups on the side chains and hydrate the triple bond of the thioalkyne to generate the corresponding thioester product $9 \mathbf{9 a}(\mathrm{HPLC} /$ UV trace in Scheme 4a)/9b in $22 \% / 19 \%$ yield over 13 steps. Furthermore, we could extend our previous method for CysLys stapling ${ }^{[13]}$ on solid phase by introducing an orthogonal protecting group on Cys. The stapling reaction, followed by acidic hydration of the thioalkyne, afforded the N -terminusCys cyclization product 10. Unfortunately, the photomediated decarboxylative alkynylation was not successful on solid phase so far.

Thiol and carboxylic acid alkynylation can be performed in tandem to access more functionalized products (Scheme 4 c ). For example, addition of a protected Cys residue to peptide-EBX $\mathbf{3 g}$, followed in one-pot by C-terminal decarboxylative alkynylation with PhEBX under photoredox conditions, gave dual functionalized product 11 in $42 \%$ yield. In addition, the S-alkynylation product can undergo $\mathrm{Ru}^{\mathrm{II}}$-catalyzed azide-thioalkyne cycloaddition (RuAtAC) ${ }^{[17]}$ to give triazole 12a. This reaction was used to introduce a fluorescent dye (6-FAM) on thioalkyne 5a, leading to 12b in excellent yield and regioselectivity (Scheme 4d).

## Decarboxylative Macrocyclization via Peptide-EBXs

We then wondered if the peptide-EBX reagents could be used to develop a new method for macrocyclization. Cyclic peptides are privileged scaffolds in drug discovery. As compared with their linear counterparts, they exhibit greater metabolic stability and enhanced pharmacokinetic properties. ${ }^{[18]}$ Based on our group's previous work ${ }^{[6]]}$ and good results from the decarboxylative cross-coupling with peptide-EBXs, we envisioned that the C-terminal radical generated from decarboxylation under photoredox conditions could be trapped by EBXs in an intramolecular

Full experimental details are provided in the Supporting Information. HPLC and MS data for 5, 6 and 8 can be found in Figures S67-S81 and Tables S31-S43. [a] Only the S-alkynylation product was isolated, the HPLC-UV ratio of S-alkynylation 5 and S-alkenylation product $\mathbf{6}$ is indicated in parenthesis. [b] The yield was determined based on LC-MS. [c] Ratio of S-VBX: S-alkynylation = 1.4:1. [d] The dr value was determined by ${ }^{13} \mathrm{C}$ NMR spectroscopy of the isolated product. [e] The dr value was not determined.
fashion, which would lead to macrocycles with a unique rigid and lipophilic phenylacetylenyl backbone (Scheme 5). Visi-ble-light photocatalysis is very attractive for biomolecule functionalization, ${ }^{[19 a]}$ and it has also been applied to peptide macrocyclization. ${ }^{[196]}$ Concerning decarboxylative approaches, only a Giese-type addition of radical formed from the C-terminus has been reported by MacMillan and co-
workers. ${ }^{[20]}$ The flexible linkers obtained using this method are very different from the rigid and linear aryl alkynes accessible through the macrocyclization of peptide-EBXs. After optimization of the reaction conditions (see Figure S88 for details, HPLC/UV trace of 13a in Scheme 5a), we obtained macrocycle 13a, resulting from cyclization of the EBX on the Lys side chain with the C-terminus, in 45 \%

isolated yield ( $60 \%$ calibrated yield) using the organic dye 4 CzIPN as the photocatalyst (Scheme 5a). Simple commercially available blue LEDs could be used as the light source, and the reaction was finished in 30 min at room temperature. Only minor side product formation resulting from intermolecular reactions was observed. We then first tested the feasibility of the head-to-side chain cyclization with different C-terminal amino acids. To our delight, peptides with Ala, Glu and Phe as C-terminal amino acids were smoothly transformed into the desired products 13b-d, demonstrating that the reaction is not limited to easier-to-
decarboxylate Pro. Notably, the carboxylate on the Glu side chain remained untouched. Even in the case of a challenging Gly residue leading to a primary radical, macrocycle $\mathbf{1 3 e}$ was still isolated in $17 \%$ yield. When a lower yield was observed for the macrocyclization, iodoalkynes and solvent adducts were observed as additional side products (see the Supporting Information for details). Considering the importance of N -methylated residues for improving membrane permeability and hydrophobicity in drug discovery, ${ }^{[21]}$ pep-tide-EBX 3e containing N -methyl Val was also examined,

Scheme 5. Scope of decarboxylative macrocyclization. a) Macrocyclization of peptide-EBXs. b) Synthetic macrocycles inspired from natural products. The reactions were performed using peptide-EBX ( $0.01 \mathrm{mmol}, 1$ equiv.), $30 \mathrm{~mol} \% 4 \mathrm{CzIPN}$ and 10 equiv. of $\mathrm{K}_{2} \mathrm{HPO}_{4}$ ( 2 M in milliQ water) in DMA ( 10 mM ) at room temperature under blue LEDs for 30 min . Yields of isolated products are given. HPLC and MS data for the products can be found in Figures S92-S115. [a] The dr value was determined based on ${ }^{1} \mathrm{H}$ NMR spectroscopy of the isolated product. [b] The dr value was not determined. [c] The dr value was determined from the HPLC-UV ratio ( 210 nm ) of the reaction crude mixture. [d] 4Cl-CzIPN ( 30 mol\%) was used as the photocatalyst. [e] Diastereoisomers separable by RP-HPLC. and it afforded cyclic peptide $\mathbf{1 3} \mathbf{f}$ in $37 \%$ yield as two separable diastereoisomers.

We then assessed the range of ring sizes accessible through our methodology. Macrocycles $\mathbf{1 3 g} \mathbf{j}$ containing 3, 4, 9 and 10 amino acid residues, respectively, were obtained in $17-59 \%$ yield. Besides head-to-side-chain macrocyclization, head-to-tail cyclization starting from EBX on the Nterminus was also possible (products $\mathbf{1 3 k} \mathbf{k}$ ). Ser (13I), Met $(\mathbf{1 3 n})$, Asp ( $\mathbf{1 3} \mathbf{p}$ ), Gln ( $\mathbf{1 3 q}$ ), His ( $\mathbf{1 3 r}$ ) were well-tolerated under the reaction conditions. The commercially available peptide FLEEV, a synthetic substrate of the enzyme $\gamma$ glutamyl carboxylase (GGCX), ${ }^{[22]}$ also underwent efficient cyclization to give $\mathbf{1 3 o}$. Free Tyr and Trp, which can be readily oxidized under photoredox conditions, are not compatible with the cyclization. Peptide sequences containing free Lys and Arg were also tested under our conditions. The corresponding cyclic peptides $\mathbf{1 3 s}$ and $\mathbf{1 3 t}$ were formed in lower yield, accompanied with more by-products. A RGD motif ${ }^{[23]}$ containing sequence cyclized efficiently to give macrocycle $\mathbf{1 3} \mathbf{u}$. Unfortunately, the head-to-tail cyclization of the tripeptide AFP did not lead to the desired product $13 \mathbf{v}$, probably due to the strain of incorporating an alkyne in the small-ring macrocycle. The cyclization of a larger 11-mer peptide was also examined, and the corresponding cyclic product $\mathbf{1 3} \mathbf{w}$ was formed in $39 \%$ yield. Up to now, we had
demonstrated the potential of our method for the synthesis of new macrocycles by diversifying both the incorporated amino acids and the ring size. As a next step, we wondered if the method could also be applied to the synthesis of synthetic analogues of known macrocyclic natural products. As a first target, we selected Sanguinamide A, a natural product extracted from Hexabranchus sanguineus that has been shown to have high membrane permeability and oral absorption. ${ }^{[24]}$ We targeted the thioazole moiety to be replaced by the phenylacetylenyl motif, as this led to an easy-to-synthesize natural amino acid sequence. The macrocyclization step gave $\mathbf{1 3 x}$ in $41 \%$ yield and 13:1 diastereoselectivity. An advantage of the alkyne group is that the shape of the macrocycle can be readily changed by reducing the triple bond to either alkene $\mathbf{1 4}$ or alkane $\mathbf{1 5 a}$, leading to completely different conformations. ${ }^{[25]}$ As a second target, we selected asperflosamide, recently isolated from a marine sponge-derived fungus. ${ }^{[26]}$ In this case, we replaced the potentially labile ester group in the macrocycle by the rigid and stable phenylalkyne linker. The desired macrocycle $\mathbf{1 3 y}$ was obtained in $28 \%$ isolated yield and 4.5:1 dr.

Figure 1. Binding affinity of peptidic macrocycles to the Keapl-Nrf2 PPI site a) Synthesis of Keap1 binding cyclic peptides, DMSO was used as the reaction solvent. HPLC and MS spectra for the products can be found in Figures S116-S121. b) Binding affinity was measured in TR-FRET competition assays. Average values of three independent measurements are shown. Details are provided in Figure S122 in the Supporting Information. [a] The approximate $\mathrm{IC}_{50}$ value of linear peptides was estimated based on the trend curves due to the low binding affinity to Keapl.

## Application towards Keap1-Nrf2 Protein-Protein Interaction Inhibition

Finally, we were wondering if these macrocyclic peptides with rigid triple bonds could be potential inhibitors of protein-protein interactions (PPIs). Keap1-Nrf2 was chosen as our target due to its importance in biological pathways related to inflammation and neurodegenerative diseases. ${ }^{[27]}$ Peptides containing a DxETGE motif showed good binding affinities to this target. ${ }^{[28]}$ Therefore, three peptide sequences, with a DAETGE motif and varying size, from a 6 -mer to an 8 -mer, were synthesized. Based on our method, we could successfully cyclize the three linear peptides 13aa13ac in moderate yield (Figure 1a). The binding of cyclic peptides and their corresponding linear precursors to Keap1 was tested using a TR-FRET assay, in which the replacement of a linear Sulfo-Cy5- $\mathrm{N}_{3}$-labeled peptide inhibitor (sequence: Ac-Propargylglycine-Peg2-LDEETGEFL- $\mathrm{NH}_{2}$ ) was measured. As compared with linear peptides, enhanced binding affinity was observed for all three cyclic peptides (Figure S118). Notably, the 8 -mer cyclic peptide $\mathbf{1 3} \mathbf{a c}$ binds to KEAP1 with 20 -fold higher affinity ( $\mathrm{IC} 50=90 \mathrm{nM}$ ) when compared to the linear precursor $\mathbf{2 a d}$ (IC50 $=1.8 \mu \mathrm{M}$; Figure 1 b ). These results indicated that our cyclization strategy displayed potential for enhancing the binding affinity for the Keap1-Nrf2 PPI site. Intriguingly, a significant 5.5 -fold drop in binding affinity was observed when we reduced the triple bond of $\mathbf{1 3} \mathbf{a c}$ to a single bond in $\mathbf{1 5 b}$, highlighting the importance of the rigid alkyne for high binding affinity. ${ }^{[29]}$

## Conclusion

To conclude, we have described the first efficient synthesis of peptide-EBX reagents both in solution and on solid phase. The unique reactivity of EBXs allowed efficient cross-coupling with Cys or C-terminal radicals generated under mild photoredox conditions, without the need for any metal catalyst or strong activating reagents, in contrast to previously existing peptide-based hypervalent iodine reagents. The decarboxylative alkynylation method could then be applied intramolecularly to the synthesis of macrocycles incorporating a rigid and linear phenylalkyne unit. This methodology allowed rapid access to cyclic peptides acting as potential inhibitors of Keap1-Nrf2 protein-protein interactions. The importance of the alkyne moiety is further supported by the lower binding affinity observed after reduction to the alkane. Considering that EBXs can be used in numerous other transformations under mild conditions, we anticipate that the discovery and application of peptideEBXs will greatly expand the toolbox of peptide/protein modifications. Further studies on introducing the EBX group in more biocompatible ways, as well as exploring new transformations on peptide-EBXs, are ongoing in our laboratory. ${ }^{[30]}$

## 1. General procedures

All reactions using anhydrous conditions were performed with oven-dried glassware, under an atmosphere of nitrogen, unless stated otherwise. Tetrahydrofuran, acetonitrile, diethyl ether and dichloromethane (DCM) were dried by passage over activated alumina, under nitrogen atmosphere, on an Innovative Technology Solvent Delivery System (water content < 10 ppm , KarlFischer titration). Dichloroethane and ethanol were purchased from Acros and trifluoroethanol was purchased from Fluorochem. DMSO was purchased from Sigma-Aldrich. All the Fmoc-protected amino acids and Rink Amide MBHA resin were purchased from GL Biochem or Bachem. 1-[Bis(dimethylamino)methylene]-1H-1,2,3-triazolo[4,5-b]pyridinium 3-oxide hexafluorophosphate (HATU, Bachem) and N,N-diisopropylethylamine (DIPEA, Iris Biotech $\mathrm{GmbH})$ were used as received. All the other reagents were purchased from ABCR, Acros, AlfaAesar, Apollo Scientific, Fluorochem, Fluka, Roth, Sigma-Aldrich and TCI and were used as such. For flash chromatography, distilled technical grade solvents were used. Chromatographic purification was performed as flash chromatography using Macherey-Nagel silica 40-63, 60 Å, using the solvents indicated as eluent with $0.1-0.5$ bar pressure. TLC was performed on Merck silica gel 60 F254 TLC aluminum or glass plates and visualized with UV light or permanganate stain. Melting points were measured on a Büchi B-540 melting point apparatus using open glass capillaries. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were recorded on a Brucker DPX- 400400 MHz spectrometer in $\mathrm{CDCl}_{3}, \mathrm{DMSO}-\mathrm{d}_{6}, \mathrm{CD}_{3} \mathrm{OD}$, or $\mathrm{D}_{2} \mathrm{O}$. All signals are reported in ppm with the internal $\mathrm{CHCl}_{3}$ signal at 7.26 ppm , the internal DMSO signal at 2.50 ppm and $\mathrm{CD}_{3} \mathrm{OD}$ as 3.35 ppm as standard. The data is being reported as: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quadruplet, $\mathrm{qi}=$ quintet, $\mathrm{m}=$ multiplet or unresolved, br = broad signal, app = apparent, coupling constant(s) in Hz, integration, interpretation. ${ }^{13}$ C-NMR spectra were recorded with 1H-decoupling on a Brucker DPX-400 100 MHz spectrometer in $\mathrm{CDCl}_{3}$, $\mathrm{DMSO}-\mathrm{d}_{6}$ or $\mathrm{CD}_{3} \mathrm{OD}$. All signals are reported in ppm with the internal $\mathrm{CHCl}_{3}$ signal at 77.16 ppm or the internal DMSO signal at 39.52 ppm as standard. Spectra were fully assigned using COSY, HSQC, HMBC and ROESY. Infrared spectra were recorded on a JASCO FT-IR B4100 spectrophotometer with an ATR PRO410-S and a ZnSe prisma and are reported as $\mathrm{cm}^{-1}$ ( $\mathrm{w}=$ weak, $\mathrm{m}=$ medium, $\mathrm{s}=$ strong, $\mathrm{br}=$ broad). High-resolution mass spectrometric measurements were performed by the mass spectrometry service of ISIC at the EPFL on LTQ Orbitrap ELITE ETD (Thermo fisher), Xevo G2-S QTOF (Waters), or LTQ Orbitrap ELITE ETD (Thermo fisher).

## 2. HPLC-MS and preparative HPLC information

## HPLC-MS analysis

HPLC-MS measurements were performed on an Agilent 1290 Infinity HPLC system with a G4226a 1290 Autosampler, a G4220A 1290 Bin Pump and a G4212A 1290 DAD detector, connected to a 6130 Quadrupole LC/MS, coupled with a Waters XBridge C18 column ( $250 \times 4.6$ $\mathrm{mm}, 5 \mu \mathrm{~m}$ ). Water:acetonitrile $95: 5$ (solvent A) and water:acetonitrile 5:95 (solvent B), each containing $0.1 \%$ formic acid, were used as the mobile phase, at a flow rate of $0.6 \mathrm{~mL} \cdot \mathrm{~min}^{-1}$. The gradient was programmed as follows:

Method 1. $100 \%$ A to $100 \%$ B in 20 minutes then isocratic for 5 minutes.
Method 2: $100 \%$ A to $100 \%$ B in 30 minutes then isocratic for 5 minutes.
Method 3: $100 \%$ A to $40 \%$ B in 8 min then isocratic for 5 min , followed by $40 \%$ B to $100 \%$ B in 7 min then isocratic for 5 min .

Method 4: $100 \%$ A for 2 minutes, then $100 \%$ A to $30 \%$ A for 2-32 minutes, then $30 \%$ A to $100 \%$ B for 32-38 minutes.

The column temperature was set up to $25^{\circ} \mathrm{C}$. Low-resolution mass spectrometric measurements were acquired using the following parameters: positive electrospray ionization (ESI), temperature of drying gas $=350^{\circ} \mathrm{C}$, flow rate of drying gas $=12 \mathrm{~L} . \mathrm{min}^{-1}$, pressure of nebulizer gas $=60 \mathrm{psi}$, capillary voltage $=2500 \mathrm{~V}$ and fragmentor voltage $=70 \mathrm{~V}$.

## Preparative HPLC

Preparative RP-HPLC were performed on an Agilent 1260 HPLC system with a G2260A 1260 Prep ALS Autosampler, a G1361a 1260 Prep Pump, a G1365C 1260 MWD detector and a G1364B 1260 FC-PS collector, coupled with a Waters XBridge semi-preparative C18 column (19 x 150 $\mathrm{mm}, 5 \mu \mathrm{~m}$ ). Water (solvent A) and water:acetonitrile 5:95 (solvent B), each containing $0.1 \%$ formic acid, were used as the mobile phase at a flow rate of $20 \mathrm{~mL} \cdot \mathrm{~min}^{-1}$.

Method 5: $100 \%$ A for 5 minutes and then a gradient to $100 \%$ B in 20 minutes, then isocratic for 5 minutes.

Method 6: $100 \%$ A to $100 \%$ B in 30 minutes then isocratic for 5 minutes.
Method 7: $100 \%$ A to $70 \%$ B in 10 minutes then isocratic for 5 minutes, then to $100 \%$ B in 10 min.

## Solid-Phase Peptide Synthesis (SPPS):

Peptides were synthesized on an MultiPep RSi parallel peptide synthesizer (Intavis) using standard Fmoc SPPS-chemistry and 2-chlorotrityl chloride resin ( $1.38 \mathrm{mmol} / \mathrm{g}, 100-200 \mathrm{mesh}$ ). The first amino acid was loaded on the resin by incubation of the Fmoc-protected monomer ( 3 equiv of the number of active sites on the resin), DIPEA (4 equiv) in dichloromethane for 2 h . Each coupling cycle was initiated by Fmoc deprotection achieved by shaking the resin with $800 \mu \mathrm{~L}$ of $20 \% \mathrm{v} / \mathrm{v}$
piperidine in dimethylformamide (DMF) at 400 rpm , over 5 minutes twice. Then the resin was washed with DMF ( $6000 \mu \mathrm{~L} x 7$ ). The coupling was carried out by shaking 2-chlorotrityl chloride resin with a Fmoc-protected monomer (4.0 equiv.), HATU (4.0 equiv.), $N$-Methylmorpholine ( 6.0 equiv.), in DMF ( 1.3 mL ), at 400 rpm , over 30 minutes twice. Capping using Cap Mixture ( $5 \%$ $\mathrm{v} / \mathrm{v} \mathrm{Ac}_{2} \mathrm{O}$ and $6 \% \mathrm{v} / \mathrm{v} 2,6$-lutidine in DMF) was carried out at the end of each cycle, followed by a DMF wash ( $6000 \mu \mathrm{~L} x 7$ ). The synthesis was finished by deprotection of Fmoc using $20 \% \mathrm{v} / \mathrm{v}$ piperidine in dimethylformamide at 400 rpm , over 5 minutes two times. The N -terminus was either left unprotected or was acylated. Acetylation of the N -terminal was achieved by incubating the resin with Cap Mixture three times. Next, washing steps were performed with dimethylformamide $(5 \times 3 \mathrm{~mL})$. Finally, resin was dried with dichloromethane ( $5 \times 3 \mathrm{~mL}$ ).

## Peptide cleavage and deprotection:

Peptides without protecting groups
Peptides were deprotected and cleaved from the resin by treatment with $2.5 \% \mathrm{v} / \mathrm{v}$ water and $2.5 \%$ $\mathrm{v} / \mathrm{v}$ Triisopropyl silane in neat trifluoroacetic acid ( 5 mL ). The resulting mixture was shaken for 2 hours, at room temperature. The resin was removed by filtration and peptides were precipitated in cold diethyl ether ( 50 mL ), followed by a 2 hours incubation at $-20^{\circ} \mathrm{C}$. Peptides were pelleted by centrifugation at 4000 rpm , for 5 minutes. Finally, the mother liquors were carefully removed.

Peptides with protecting groups
Peptides were deprotected and cleaved from the resin by treatment with a $20 \%$ solution of HFIP in DCM. The resulting mixture was shaken for 1 hour at room temperature. The resin was removed by filtration and peptides were precipitated in cold diethyl ether ( 50 mL ), followed by a 2 hours incubation at $-20^{\circ} \mathrm{C}$. Peptides were pelleted by centrifugation at 4000 rpm , for 5 minutes. Finally, the mother liquors were carefully removed.

The precipitations were further dissolved in water and acetonitrile, shell freeze and lyophilize to yield the desired crude peptides. If necessary, preparative HPLC purification was carried out.

## Peptide analysis:

## MS/MS fragmentation:

The regioselectivity of the introduction of EBX onto peptides was confirmed using MS/MS analysis. The spectra were obtained by the mass spectrometry service of ISIC at the EPFL using Thermo Orbitrap Elite instrument. The desired ion was selected using mass filters and submitted to fragmentations. The obtained data was analyzed using fragment generation program on eln.epfl.ch. ${ }^{1}$ For the calculations peak threshold for intensity was set to $0.5 \%$ and $0.03 \%$ for quantity, precision was set to 5 ppm and minimal similarity: $70 \%$. The peaks were compared to

[^1]theoretical peaks. The theoretical peak width was calculated from the mass of the ion by the formula provided in the script. The zone was set to -0.5 to 3.5 ppm . y and b fragments with and without linker were selected and reported. In the cases were fragmentation was low, c and z fragments and/or fragments arising from neutral losses were included.

## 3. Synthesis of bifunctional alkynylation reagents

## General procedure:

Following a reported procedure, ${ }^{2}$ trimethylsilyl triflate ( $0.12 \mathrm{~mL}, 0.66 \mathrm{mmol}, 1.1$ equiv) was added to a suspension of 2- iodosylbenzoic acid $\mathbf{S 1}(158 \mathrm{mg}, 0.600 \mathrm{mmol}, 1.00$ equiv) in DCM ( 2 mL ) at RT. The resulting suspension was stirred for 1 h , followed by the drop wise addition of $\mathbf{S 2}$ (498 $\mathrm{mg}, 1.25 \mathrm{mmol}, 1.1$ equiv), which was dissolved in DCM ( 1 mL ). The resulting suspension was stirred for 4 h at RT. A saturated solution of $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$ was then added and the mixture was stirred vigorously for 10 minutes, the two layers were separated and the organic layer was washed with sat. $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and evaporated under reduced pressure. The mixture was purified by column chromatography with pure ethyl acetate to afford $\mathbf{1 a}(212 \mathrm{mg}$, $0.380 \mathrm{mmol}, 63 \%$ ) as a colorless solid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.45(\mathrm{dd}, J=6.7,2.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 8.30-8.23(\mathrm{~m}, 3 \mathrm{H}, \mathrm{ArH})$, 7.82 (ddd, $J=6.5,4.4,1.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}$ ), 7.79 (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}$ ).

Spectroscopic data was consistent with the values reported in literature. ${ }^{2}$

## General procedure: ${ }^{3}$

To a solution of 2-(4-iodophenyl)acetic acid $\mathbf{S 3}$ ( $2.5 \mathrm{~g}, 10 \mathrm{mmol}$, 1 equiv.), $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(0.35 \mathrm{~g}$, $0.50 \mathrm{mmol}, 5 \mathrm{~mol} \%$ ), $\mathrm{CuI}(0.19 \mathrm{mg}, 1.0 \mathrm{mmol}, 10 \mathrm{~mol} \%)$ in $\mathrm{Et}_{3} \mathrm{~N}(40 \mathrm{~mL})$ under argon, trimethylsilylacetylene ( $1.7 \mathrm{~g}, 2.4 \mathrm{~mL}, 17 \mathrm{mmol}, 1.7$ equiv.) was added. The mixture was stirred overnight at room temperature, then filtered through a pad of celite ${ }^{\circledR}$. The residue was washed with EtOAc ( 100 mL ) and the organic layer was successively washed with aqueous 1 M HCl solution ( $3 \times 30 \mathrm{~mL}$ ), water ( 50 mL ) and brine ( $2 \times 30 \mathrm{~mL}$ ). After drying ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), filtration and concentration under reduced pressure, the desired product $\mathbf{S 4}$ was obtained without further purification.
The crude product $\mathbf{S 4}$ and $\operatorname{DCC}(2.1 \mathrm{~g}, 20 \mathrm{mmol}, 2$ equiv.) were added in the 50 mL vial and dissolved in DCM ( 20 mL ) and stirred for 10 min , at which time, pentaflurophenol ( $2.8 \mathrm{~g}, 15$ mmol, 1.5 equiv.) was added and the reaction was stirred overnight. After the reaction, the mixture was filtered through a pad of celite. The solution was concentrated under vaccum, and the residue

[^2]was purified by column chromatography (Pentane/EA 10:1) to afford the desired product $\mathbf{S 5}$ as colorless solid ( $3.4 \mathrm{~g}, 8.4 \mathrm{mmol}, 84 \%$ yield,).
$\mathrm{R}_{\mathrm{f}}\left(\right.$ Pentane/EA 10:1) $=0.25$. M.P. 65.6-68.9 ${ }^{\circ} \mathrm{C}$.
${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.48\left(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right), 7.29\left(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right)$, 3.95 (s, $2 \mathrm{H}, \mathrm{CH}_{2}$ ), $0.25\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiCH}_{3}\right)$.
${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 167.1,141.2\left(\mathrm{dm}, J=239.7 \mathrm{~Hz}, C_{\mathrm{Ar}}-\mathrm{F}\right), 139.6(\mathrm{dm}, J=253.5 \mathrm{~Hz}$, $\left.C_{\mathrm{Ar}}-\mathrm{F}\right), 137.9\left(\mathrm{dm}, J=248.7 \mathrm{~Hz}, C_{\mathrm{Ar}}-\mathrm{F}\right), 132.5\left(C_{\mathrm{Ar}}\right), 132.3\left(C_{\mathrm{Ar}}\right), 125.1\left(\mathrm{~m}, C_{\mathrm{Ar}}-\mathrm{O}\right), 122.9\left(C_{\mathrm{Ar}}\right)$, $104.5\left(C_{\mathrm{Ar}}\right), 95.0\left(\mathrm{CC}-C_{\mathrm{Ar}}\right), 77.3\left(C \mathrm{C}-C_{\mathrm{Ar}}\right), 40.1\left(\mathrm{CH}_{2}\right), 0.00\left(\mathrm{SiCH}_{3}\right)$.
IR ( $\mathrm{cm}^{-1}$ ): 2962, 2160, 1790, 1520, 1250, 1219, 1092.
HRMS (nanochip-ESI/LTQ-Orbitrap) m/z: $[\mathrm{M}+\mathrm{H}]^{+}$Calcd for $\mathrm{C}_{19} \mathrm{H}_{16} \mathrm{~F}_{5} \mathrm{O}_{2} \mathrm{Si}^{+}$399.0834; Found 399.0842.

## Alternative pathway:

Sometimes the work-up of Sonogashira coupling with the free acid didn't work properly, which resulted in brown or yellow solid for the product. One alternative pathway was developed. Following a reported procedure: ${ }^{4}$
MEM protection:
$\mathrm{K}_{2} \mathrm{CO}_{3}(1.6 \mathrm{~g}, 12 \mathrm{mmol}, 1.2$ equiv.) and 2-methoxyethoxymethyl chloride ( MEMCl ) ( $1.5 \mathrm{~mL}, 13$ mmol, 1.3 equiv.) were added to a reaction vessel containing a solution of 2-(4-iodophenyl)acetic acid $\mathbf{S 3}(2.6 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) in DMF ( 20 mL ). The mixture was stirred at room temperature for 2 h , poured onto $5 \% \mathrm{LiCl}$ solution ( 20 mL ), and then extracted with EtOAc ( $3 \times 10 \mathrm{~mL}$ ). The combined layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The desired product S6 was obtained as brown oil ( $3.2 \mathrm{~g}, 9.5 \mathrm{mmol}, 95 \%$ yield) without further purification.

## Sonogashira coupling:

To a solution of crude compound $\mathbf{S 6}(3.2 \mathrm{~g}, 9.5 \mathrm{mmol}$. 1 equiv. $), \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(167 \mathrm{mg}, 0.238$ $\mathrm{mmol}, 2.5 \mathrm{~mol} \%$ ), CuI ( $90 \mathrm{mg}, 0.48 \mathrm{mmol}, 5 \mathrm{~mol} \%$ ) in $\mathrm{Et}_{3} \mathrm{~N}$ ( 30 mL ) under argon, trimethylsilylacetylene ( $1.4 \mathrm{~g}, 2.0 \mathrm{~mL}, 14 \mathrm{mmol}, 1.5$ equiv.) was added. The mixture was stirred overnight at room temperature, then filtered through a pad of celite ${ }^{\circledR}$. The residue was concentrated under reduced pressure, the desired product $\mathbf{S 7}$ was purified by column chromatography with (Pentane/EA 4:1) as brown oil ( $2.8 \mathrm{~g}, 8.7 \mathrm{mmol}, 92 \%$ yield).
$\mathrm{R}_{\mathrm{f}}($ Pentane/EA 4:1) $=0.3$.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.42\left(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right), 7.22\left(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right)$, $5.32\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{O}\right), 3.74-3.67\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{OCH}_{2}\right), 3.64\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 3.53-3.46\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{OCH}_{2}\right)$, 3.36 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{OCH}_{3}$ ), 0.24 ( $\left.\mathrm{s}, 9 \mathrm{H}, \mathrm{Si}(\mathrm{Me})_{3}\right)$.
${ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.8,134.2,132.3,129.3,122.2,104.9,94.5,89.9,71.5,69.7$, 59.2, 41.5, 0.1.

[^3]HRMS (nanochip-ESI/LTQ-Orbitrap) m/z: [M + Na] ${ }^{+}$Calcd for $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{NaO}_{4} \mathrm{Si}^{+} 343.1336$; Found 343.1336.

## MEM deprotection:

3N HCl ( 12 mL ) and MEM-protected $\mathbf{S 6}(2.8 \mathrm{~g}, 8.7 \mathrm{mmol}, 1$ equiv.) were added into in THF (30 mL ). The reaction mixture was stirred overnight and was then concentrated under vacuum. The residue was extracted 3 times with EA, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated to give the desired product $\mathbf{S 4}$ as yellow solid ( $1.8 \mathrm{~g}, 7.9 \mathrm{mmol}, 83 \%$ yield) without further purification.

## Condensation:

The product $\mathbf{S 4}(1.8 \mathrm{~g}, 7.9 \mathrm{mmol})$, pentaflurophenol ( $2.2 \mathrm{~g}, 12 \mathrm{mmol}, 1.5$ equiv.), DMAP ( 0.096 $\mathrm{g}, 0.79 \mathrm{mmol}, 0.1$ equiv.) and $\mathrm{EDC} \cdot \mathrm{HCl}(2.2 \mathrm{~g}, 12 \mathrm{mmol}, 1.5$ equiv.) were added in the 50 mL vial and dissolved in DCM $(30 \mathrm{~mL})$ at room temperature and stirred overnight. After the reaction, the mixture was quenched with 20 mL saturated $\mathrm{NaHCO}_{3}$, and extracted with DCM ( $3 \times 10 \mathrm{~mL}$ ). The combined solution was dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under vacuum. The residue was purified by column chromatography (Pentane/EA 10:1) to afford the desired product $\mathbf{S 5}$ as colorless solid ( $1.9 \mathrm{~g}, 4.7 \mathrm{mmol}, 60 \%$ yield).

1b

## General procedure:

Trimethylsilyl triflate ( $0.23 \mathrm{~mL}, 1.3 \mathrm{mmol}, 1.1$ equiv) was added to a suspension of 2 iodosylbenzoic acid $\mathbf{S} 1(300 \mathrm{mg}, 1.13 \mathrm{mmol}, 1.0$ equiv) in DCM ( 2 mL ) at RT. The resulting suspension was stirred for 1 h , followed by the drop wise addition of $\mathbf{S 5}(498 \mathrm{mg}, 1.25 \mathrm{mmol}, 1.1$ equiv), which was dissolved in DCM ( 1 mL ). The resulting suspension was stirred for 4 h at RT. A saturated solution of $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$ was then added and the mixture was stirred vigorously for 10 minutes, the two layers were separated and the organic layer was washed with sat. $\mathrm{NaHCO}_{3}$ $(20 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and evaporated under reduced pressure. The mixture was purified by column chromatography with pure ethyl acetate to afford $\mathbf{1 b}$ ( $190 \mathrm{mg}, 0.332 \mathrm{mmol}$, 29\%) as a colorless fluffy solid.
$\mathrm{R}_{\mathrm{f}}(\mathrm{EA})=0.2 .{ }^{1} \mathrm{H}$ NMR $\left(800 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.42\left(\mathrm{dd}, J=7.1,2.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right), 8.24(\mathrm{dd}, J=$ $\left.7.8,1.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right), 7.81-7.75\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right), 7.62\left(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}\right), 7.44(\mathrm{~d}, J=$ $7.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}_{\mathrm{Ar}}-\mathrm{H}$ ), $4.04\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$.

## 4. General procedure for synthesis of peptide-EBXs

To a solution of peptide ( 0.03 mmol ), bifunctional EBX reagent $\mathbf{1 b}$ ( $0.033 \mathrm{mmol}, 1.1$ equiv.) in DMF ( 1.5 mL ), DIPEA ( $10 \mu \mathrm{~L}, 0.060 \mathrm{mmol}, 2$ equiv.) was added into the solution (concentration:

20 mM ) and the mixture was stirred for 20 min without protection of atmosphere or light. For the isolation, the crude was subjected to Prep-HPLC without dilution, followed by lyophilization.

Common side-products that can be observed in HPLC:

IBA

EBX hydrolysis

### 4.1 Test on the selective amide formation

Figure S1: HPLC-UV chromatogram ( 210 nm ) of the crude 3a by Method 1. The ratio was determined based on the UV absorption ( 210 nm ) of 3a and 4a.

Figure S2: HPLC-UV chromatogram ( 210 nm ) of the crude by Method 1. The ratio was determined based on the UV absorption ( 210 nm ) of $\mathbf{3 b}$ and $\mathbf{4 b}$.
$N$-benzyl-2-(4-((3-oxo-113-benzo[d][1,2]iodaoxol-1(3H)-yl)ethynyl)phenyl)acetamide (3b)
Following the general procedure, the reaction was conducted in 0.048 mmol scale. The desired product 3b ( $12 \mathrm{mg}, 0.025 \mathrm{mmol}, 63 \%$ yield) was isolated by Method 6.

## Peptide EBX of Ac-KLAFR (3h)

Figure S13: HPLC-UV chromatogram ( 210 nm ) of Ac-KLAFR by Method 1.
HRMS (ESI/QTOF) m/z: $[\mathrm{M}+\mathrm{H}]^{+}$Calcd for $\mathrm{C}_{32} \mathrm{H}_{54} \mathrm{~N}_{9} \mathrm{O}_{7}{ }^{+}$676.4141; Found 676.4147.
Following the general procedure, the reaction was conducted in 0.044 mmol scale. The desired product $\mathbf{3 h}(17 \mathrm{mg}, 0.016 \mathrm{mmol}, 36 \%)$ was isolated by Method 5.

Figure S14: HPLC-UV chromatogram ( 210 nm ) of $\mathbf{3 h}$ and MS(ESI) by Method 1.
HRMS (nanochip-ESI/LTQ-Orbitrap) m/z: $\left[\mathrm{M}+\mathrm{H}_{2}\right]^{+2}$ Calcd for $\mathrm{C}_{49} \mathrm{H}_{64} \mathrm{IN}_{9} \mathrm{O}_{10}{ }^{+2} 532.6905$; Found 532.6898.

Table S6: MS/MS fragmentation of 3h:

## Peptide EBX of Ac-KLAFE (3i)

Figure S15: HPLC-UV chromatogram ( 210 nm ) of Ac-KLAFE by Method 1.
HRMS (nanochip-ESI/LTQ-Orbitrap) m/z: [M + H ] ${ }^{+}$Calcd for $\mathrm{C}_{31} \mathrm{H}_{49} \mathrm{~N}_{6} \mathrm{O}_{9}{ }^{+}$649.3556; Found 649.3545.

Following the general procedure, the reaction was conducted on a 0.046 mmol scale. The desired product $3 \mathbf{i}$ ( $22 \mathrm{mg}, 0.021 \mathrm{mmol}, 46 \%$ yield) was isolated with Method 5.

Retention time: $\quad 10.685 \mathrm{~min} \quad$ Area Percent: $100 \%$

Figure S16: HPLC-UV chromatogram ( 210 nm ) of $\mathbf{3 i}$ and MS(ESI) by Method 1.

HRMS (nanochip-ESI/LTQ-Orbitrap) m/z: $[\mathrm{M}+\mathrm{H}]^{+}$Calcd for $\mathrm{C}_{48} \mathrm{H}_{58} \mathrm{IN}_{6} \mathrm{O}_{12}{ }^{+}$1037.3152; Found 1037.3157.

Table S7: MS/MS fragmentation of 3i:

$k=$ Lys(C17H9IO3)
Nter $=\mathbf{C 2 H} 30$

|  |  |  | MF |  |  |  |

## 5. Synthesis of peptide-EBXs on solid phase

## Loading efficiency evaluation: ${ }^{5}$

The loading efficiency was evaluated through treatment of the resin with $20 \%$ piperidine/DMF (3 $\mathrm{mL}, 2 \times 3 \mathrm{~min}$ ) to deprotect the Fmoc group. The combined deprotection solutions were diluted to 10 mL with $20 \%$ piperidine/DMF. An aliquot of this mixture ( $50 \mu \mathrm{~L}$ ) was diluted 200 -fold with $20 \%$ piperidine/DMF and the UV absorbance of the piperidine-fulvene adduct was measured ( $\lambda=$ $301 \mathrm{~nm}, \varepsilon=7800 \mathrm{M}-1 \mathrm{~cm}-1$ ) to quantify the amount of amino acid loaded onto the resin. The theoretical maximum for the reported yields of all isolated peptides is based on the numerical value obtained from the resin loading ( $1.38 \mathrm{mmol} / \mathrm{g}$ for 2 -chlorotrityl chloride resin, $0.34 \mathrm{mmol} / \mathrm{g}$ for rink amide resin).
Procedure for EBXs introductions:

[^4]Peptide-EBX 3s was prepared on a $28 \mu \mathrm{~mol}$ scale from resin-bound substrate. Bifunctional EBX ( $32 \mathrm{mg}, 55 \mu \mathrm{~mol}, 2.0$ equiv.) was weighed into the syringe reactor and dissolved in 2 mL DCM. Then DIPEA ( $19.0 \mu \mathrm{~L}, 110 \mu \mathrm{~mol}, 4.0$ equiv.) was added into the reactor and the mixture was agitated at room temperature for 1 hour. The resin was then filtered and washed with DCM ( $3 \times 3$ mL ). The procedure was repeated one more time to ensure the $N$-terminus was fully reacted. Following HFIP/DCM cleavage from resin and removal of volatiles, the crude peptide was purified by reverse-phase HPLC with Method 5 and lyophilized to afford peptide 3s as a fluffy white solid ( $5.5 \mathrm{mg}, 19 \%$ yield based on the original resin loading).

Figure S60: HPLC-UV chromatogram ( 210 nm ) of the crude and purified product 3s by Method 1.

Peptide-EBX 3t was prepared on a $42 \mu \mathrm{~mol}$ scale from resin-bound substrate. Bifunctional EBX ( $49 \mathrm{mg}, 84 \mu \mathrm{~mol}, 2.0$ equiv.) was weighed into the syringe reactor and dissolved in 2 mL DCM. Then DIPEA ( $30.0 \mu \mathrm{~L}, 168 \mu \mathrm{~mol}, 4.0$ equiv.) was added into the reactor and the mixture was agitated at room temperature for 1 hour. The resin was then filtered and washed with DCM ( $3 \times 3$
mL ). The procedure was repeated one more time to ensure the $N$-terminus was fully reacted. Following HFIP/DCM cleavage from resin and removal of volatiles, the crude peptide was purified by reverse-phase HPLC with Method 5 and lyophilized to afford peptide 3t as a fluffy white solid ( $8.1 \mathrm{mg}, 17 \%$ yield based on the original resin loading).

Figure S61: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude and purified product 3t by Method 1.
HRMS (Nanochip-based ESI/LTQ-Orbitrap) m/z: $\left[\mathrm{M}+\mathrm{H}_{2}\right]^{+2}$ Calcd for $\mathrm{C}_{55} \mathrm{H}_{66} \mathrm{IN}_{7} \mathrm{O}_{10}{ }^{+2} 555.6952$; Found 555.6949.

Peptide-EBX 3u was prepared on a $28 \mu \mathrm{~mol}$ scale from resin-bound substrate. Bifunctional EBX ( $32 \mathrm{mg}, 56 \mu \mathrm{~mol}, 2.0$ equiv.) was weighed into the syringe reactor and dissolved in 2 mL DCM . Then DIPEA ( $19.0 \mu \mathrm{~L}, 112 \mu \mathrm{~mol}, 4.0$ equiv.) was added into the reactor and the mixture was agitated at room temperature for 1 hour. The resin was then filtered and washed with DCM ( $3 \times 3$ mL ). The procedure was repeated one more time to ensure the $N$-terminus was fully reacted. Following HFIP/DCM cleavage from resin and removal of volatiles, the crude peptide was purified by reverse-phase HPLC with Method 5 and lyophilized to afford peptide $\mathbf{3 u}$ as a fluffy white solid ( $4.5 \mathrm{mg}, 15 \%$ yield based on the original resin loading).

Figure S63: HPLC-UV chromatogram ( 210 nm ) of the crude and purified product $\mathbf{3 u}$ by Method 1.

## Peptide EBX of ETFLDLPALLP (3ad)

Peptide-EBX 3ad was prepared on a $50 \mu \mathrm{~mol}$ scale from resin-bound substrate. Bifunctional EBX ( $57.3 \mathrm{mg}, 100 \mu \mathrm{~mol}, 2.0$ equiv.) was weighed into the syringe reactor and dissolved in 2 mL DCM. Then DIPEA ( $35.7 \mu \mathrm{~L}, 200 \mu \mathrm{~mol}, 4.0$ equiv.) was added into the reactor and the mixture was agitated at room temperature for 1 hour. The resin was then filtered and washed with DCM $(3 \times 3$ $\mathrm{mL})$. The procedure was repeated one more time to ensure the $N$-terminus was fully reacted. Following TFA cleavage from resin and removal of volatiles, the crude peptide was purified by reverse-phase HPLC with Method 5 and lyophilized to afford peptide 3ad as a fluffy white solid ( $14.5 \mathrm{mg}, 18 \%$ yield based on the original resin loading).

Figure S64: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude and purified product 3ad by Method 1.

Peptide-EBX 3v was prepared on a $14 \mu \mathrm{~mol}$ scale from resin-bound substrate. Then the resin was treated with $1 \mathrm{~mL} 5 \% \mathrm{~N}_{2} \mathrm{H}_{4} \mathrm{H}_{2} \mathrm{O}$ in DMF and agitated for 10 min ( 2 times) to deprotect the Lys. Bifunctional EBX ( $16 \mathrm{mg}, 28 \mu \mathrm{~mol}, 2.0$ equiv.) was then weighed into the syringe reactor and dissolved in 2 mL DCM. Then DIPEA ( $9.5 \mu \mathrm{~L}, 56 \mu \mathrm{~mol}, 4$ equiv.) was added into the reactor and agitated at room temperature for 1 hour. The resin was then filtered and washed with DCM ( $3 \times 3$ mL ). The procedure was repeated one more time to ensure the $N$-terminus was fully reacted. Following HFIP/DCM cleavage from resin and removal of volatiles, the crude peptide was purified by reverse-phase HPLC with Method 5 and lyophilized to afford peptide $\mathbf{3 v}$ as a fluffy white solid ( $3.6 \mathrm{mg}, 4.6 \mu \mathrm{~mol}, 34 \%$ yield based on the original resin loading).

Figure S65: HPLC-UV chromatogram ( 210 nm ) of the crude and purified product 3v by Method 1.

## Procedure:

Peptide-EBX 3q was prepared on a $14 \mu \mathrm{~mol}$ scale from resin-bound substrate. Bifunctional EBX ( $156 \mathrm{mg}, 28 \mu \mathrm{~mol}, 2.0$ equiv.) was weighed into the syringe reactor and dissolved in 2 mL DCM. Then DIPEA ( $9.5 \mu \mathrm{~L}, 56 \mu \mathrm{~mol}, 4.0$ equiv.) was added into the reactor and the mixture was agitated at room temperature for 1 hour. Then the resin was treated with $1 \mathrm{~mL} 5 \% \mathrm{~N}_{2} \mathrm{H}_{4} \mathrm{H}_{2} \mathrm{O}$ in DMF and agitated for 10 min ( 2 times) to deprotect the Lys. The resin was then filtered and washed with DCM $(3 \times 3 \mathrm{~mL})$. The procedure was repeated one more time to ensure the Lys was fully reacted. Following HFIP/DCM cleavage from resin and removal of volatiles, the crude peptide was purified by reverse-phase HPLC with Method 5 and lyophilized to afford peptide $\mathbf{3 q}$ as a fluffy white solid ( $1.9 \mathrm{mg}, 1.6 \mu \mathrm{~mol}, 11 \%$ yield based on the original resin loading).

Figure S66: HPLC-UV chromatogram ( 210 nm ) of the crude and purified product $\mathbf{3 q}$ by Method 1.

## 6. General procedure for S-alkynylation of peptide-EBXs:

Peptide-EBX ( $5 \mu \mathrm{~mol}, 1$ equiv.) was weighed on the analytical balance and dissolved in $200 \mu \mathrm{~L}$ non-degassed DMA. Afterwards, $55 \mu \mathrm{~L}$ of a solution of Cys containing peptides ( 100 mM in DMF, for Glutathione 100 mM in DMF/ $\mathrm{H}_{2} \mathrm{O}$ 1:1) $(5.5 \mu \mathrm{~mol}, 1.1$ equiv.), $10 \mu \mathrm{~L}$ DIPEA ( 100 mM in DMF, $10 \mu \mathrm{~mol}, 2$ equiv.) were added. The reaction was stirred for 1 h at RT without protecting from atmosphere and light.
At the end of the reaction, $10 \mu \mathrm{~L}$ of the crude was diluted with $90 \mu \mathrm{~L}$ of $\mathrm{MeCN} /$ water $1: 1$ and injected in RP-HPLC. The desired products were isolated by Prep-RP-HPLC.
HPLC-UV ratio was determined by taking the ration of $\mathrm{A}_{\text {prod }} / \mathrm{A}_{\text {total }}$ where $\mathrm{A}_{\text {prod }}=$ area in mAU of the product peak and $\mathrm{A}_{\text {total }}=$ area in mAU of the combined peptide containing species
Common side-products that can be observed in HPLC:

S-alkynylation product of AcKLAFG (5a)

Following the general procedure, the reaction was conducted in $5 \mu \mathrm{~mol}$ scale. HPLC ratio (210 nm ) of the product: $84 \%$. The desired product $\mathbf{5 a}(3.3 \mathrm{mg}, 3.7 \mu \mathrm{~mol}, 75 \%$ yield) was isolated by Method 6.

Figure S67: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude and purified product 5a by Method 1.

## 7. Procedures for $\mathrm{S}-\mathrm{VBX}$ formation of peptide-EBXs:

HPLC-UV ratio was determined by taking the ration of $\mathrm{A}_{\text {prod }} / \mathrm{A}_{\text {total }}$ where $\mathrm{A}_{\text {prod }}=$ area in mAU of the product peak and $\mathrm{A}_{\text {total }}=$ area in mAU of the combined peptide containing species Common side-products can be observed in HPLC:

## S-VBX of Ac-KLAFG (6a)

## Procedure:

Peptide-EBX (Ac-KLAFG) ( $2.6 \mathrm{mg}, 2.7 \mu \mathrm{~mol}, 1.5$ equiv.) was weighed on the analytical balance in an Eppendorf tube. Afterwards, $18 \mu \mathrm{~L}$ of a solution of $L$-Glutathione ( 100 mM in water) ( 1.8 $\mu \mathrm{mol}, 1.0$ equiv.) The reaction mixture was then diluted with $347 \mu \mathrm{~L}$ Tris buffer ( $\mathrm{pH} 9.0,100 \mathrm{mM}$ ), overall concentration: 5 mM , and placed on a shaker and shaken for 3 h at RT without protecting from atmosphere and light.
At the end of the reaction, $10 \mu \mathrm{~L}$ of the crude was diluted with $60 \mu \mathrm{~L} \mathrm{MeCN} /$ water 1:1 and injected in RP-HPLC. HPLC ratio ( 210 nm ) of the product: > 95\%. The desired products were isolated by Prep-RP-HPLC. The desired product $\mathbf{6 a}(1.6 \mathrm{mg}, 1.2 \mu \mathrm{~mol}, 71 \%$ yield) was isolated by Method 5.

Figure S73: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude and purified product 6 by Method 1.
HRMS (nanochip-ESI/LTQ-Orbitrap) m/z: $[\mathrm{M}+\mathrm{HNa}]^{+2}$ Calcd for $\mathrm{C}_{55} \mathrm{H}_{71} \mathrm{IN}_{9} \mathrm{NaO}_{16} \mathrm{~S}^{+2} 647.6835$; Found 647.6875.

Table S37: MS/MS fragmentation of 6a:

## His6-Cys-Ub

LCMS - ESI ionization, C4 column, LC $10-90 \% \mathrm{ACN}+0.1 \% \mathrm{FA}$, flowrate $5 \mathrm{ml} / \mathrm{min}$, over 6 min , TOF-MS $200-2000 \mathrm{~m} / \mathrm{z}$ ES+, MS continuum scan rate $200 \mathrm{~ms} / \mathrm{scan}$. Deconvolution of spectrum with MaxEnt1 (5-30,000 Da, 0.5Da)

Figure S74: MS analysis on XEVO G2-XS Q-TOF.

Figure S75: Mass spectrum of $\mathrm{His}_{6}$ - $\mathrm{Cys}-\mathrm{Ub}$.

HRMS (HESI/LTQ-Orbitrap) m/z: $\left[\mathrm{M}+\mathrm{H}_{15}\right]^{+15}$ Calcd for $\mathrm{C}_{466} \mathrm{H}_{771} \mathrm{~N}_{142} \mathrm{O}_{143} \mathrm{~S}_{2}{ }^{+15} 714.3455$. Found 714.3629.

## His6-Cys-Ubiquitin S-VBX modification product ( $\mathbf{6 b}, \mathbf{5 g}$ )

## Procedure:

Protein His6-Tag-Ub ( $0.44 \mathrm{mg}, 0.004 \mu \mathrm{~mol})$ was weighed in an Eppendorf tube. Afterwards, 10 $\mu \mathrm{L}$ of Peptide-EBX (Ac-KLAFG) ( 2 equiv., 7.8 mM in Tris buffer $\mathrm{pH} 9.0,100 \mathrm{mM}$ ) and $260 \mu \mathrm{~L}$ Tris buffer ( $\mathrm{pH} 9.0,100 \mathrm{mM}$ ), overall concentration $150 \mu \mathrm{M}$, were added in the tube. The reaction mixture was then placed on a shaker and shaken for 3 h at RT without protecting from atmosphere and light.
At the end of the reaction, $10 \mu \mathrm{~L}$ of the crude was diluted with $40 \mu \mathrm{~L}$ water and injected in RPHPLC using Method 4. The yield was determined based on the LC/MS ration as $100 \%$ for (mixture of $\mathbf{6 b}$ and $\mathbf{5 g}, \mathbf{6 b}: \mathbf{5 g}=1.4: 1$ ). The ratio of $\mathbf{6 b}$ and $\mathbf{5 g}$ was determined by the relative peak intensity of deconvoluted mass spectrum.

Figure S76: LC/MS of reaction crude by Method 4 and deconvoluted mass spectrum.

Figure S77: LC/MS chromatogram ( 210 nm ) of the crude by Method 1.
For alkynylation product 5g: HRMS (HESI/LTQ-Orbitrap) m/z: $\left[\mathrm{M}+\mathrm{H}_{15}\right]^{+15} \mathrm{Calcd}$ for $\mathrm{C}_{504} \mathrm{H}_{819} \mathrm{~N}_{148} \mathrm{O}_{151} \mathrm{~S}_{2}{ }^{+15} 762.1338$. Found 762.0696.

For S-VBX product 6b: HRMS (HESI/LTQ-Orbitrap) m/z: $\left[\mathrm{M}+\mathrm{H}_{15}\right]^{+15} \mathrm{Calcd}$ for $\mathrm{C}_{511} \mathrm{H}_{824} \mathrm{~N}_{148} \mathrm{O}_{153} \mathrm{~S}_{2}{ }^{+15} 778.6643$. Found 778.6655.

\end{aligned}
$$

## 8. Decarboxylative cross-coupling:

## General Procedure

Peptide-EBX ( $5 \mu \mathrm{~mol}, 1$ equiv.) were weighed on the analytical balance and dissolved in $200 \mu \mathrm{~L}$ non-degassed DMA in a 2 mL vial. Afterwards, $100 \mu \mathrm{~L}$ of a solution of dipeptide ZGP ( $10 \mu \mathrm{~mol}$, 2 equiv.) ( 100 mM in DMA), the peptide solution, $60 \mu \mathrm{~L}$ of a solution of CzIPN ( $30 \mathrm{~mol} \%, 25 \mathrm{mM}$ in DMA), $25 \mu \mathrm{~L}$ of $2 \mathrm{M} \mathrm{K}_{2} \mathrm{HPO}_{4}$ ( 10 equiv.) in milli-Q purified water and $115 \mu \mathrm{~L}$ of DMA were placed into the vial, overall concentration: 10 Mm . The vial was then capped and degassed by bubbling with $\mathrm{N}_{2}$ for 20 min . The reaction was stirring under Blue LEDs irradiation for 30 min at RT.
At the end of the reaction, $10 \mu \mathrm{~L}$ of the crude was diluted with $90 \mu \mathrm{~L}$ of $\mathrm{MeCN} /$ water $1: 1$ and injected in RP-HPLC. The desired products were isolated by Prep-RP-HPLC.
HPLC UV ratio was determined by taking the ration of $A_{\text {prod }} / A_{\text {total }}$ where $A_{\text {prod }}=$ area in mAU of the product peak and $\mathrm{A}_{\text {total }}=$ area in mAU of the combined peptide containing species (product, DMA adduct, iodoalkyne).
Common side-products that can be observed in HPLC.

## Decarboxylative alkynylation of AcKLAFG (8a)

Following the general procedure, the reaction was conducted in $5 \mu \mathrm{~mol}$ scale. HPLC ratio (210 nm ) of the product: > $95 \%$, dr 1.2: 1 (determined by ${ }^{13} \mathrm{C}$ NMR). The desired product $\mathbf{8 a}(2.6 \mathrm{mg}$, $2.6 \mu \mathrm{~mol}, 52 \%$ yield) was isolated by Method 5.

Figure S78: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) and MS(ESI) of the crude and purified product 8a by Method 1.
${ }^{1} H$ NMR $\left(600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \delta 7.44-7.15(\mathrm{~m}, 14 \mathrm{H}), 5.12(\mathrm{~s}, 2 \mathrm{H}), 4.63(\mathrm{dd}, J=9.1,5.2 \mathrm{~Hz}, 1 \mathrm{H})$, 4.37 (dd, $J=10.4,4.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.31-4.13(\mathrm{~m}, 3 \mathrm{H}), 4.03-3.93(\mathrm{~m}, 1 \mathrm{H}), 3.89(\mathrm{dd}, J=3.5,1.8$ $\mathrm{Hz}, 2 \mathrm{H}), 3.72-3.61(\mathrm{~m}, 1 \mathrm{H}), 3.55-3.47(\mathrm{~m}, 3 \mathrm{H}), 3.25-3.16(\mathrm{~m}, 3 \mathrm{H}), 2.97$ (ddd, $J=14.0,9.1$, $1.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.35-2.28(\mathrm{~m}, 1 \mathrm{H}), 2.27-2.22(\mathrm{~m}, 1 \mathrm{H}), 2.14(\mathrm{td}, J=12.5,9.6,4.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.03$ (dt, $J=6.4,3.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.99(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 3 \mathrm{H}), 1.78(\mathrm{ddt}, J=12.4,9.4,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.70(\mathrm{td}, J$ $=13.5,12.6,6.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.67-1.49(\mathrm{~m}, 5 \mathrm{H}), 1.40(\mathrm{dt}, J=15.7,8.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.25(\mathrm{~d}, J=7.1 \mathrm{~Hz}$, 3H), $1.00-0.95(\mathrm{~m}, 3 \mathrm{H}), 0.94-0.90(\mathrm{~m}, 3 \mathrm{H})$.

9. S-alkynylation and S-esterification on solid phase

## Procedure:

Peptide EBX was prepared on a $13.8 \mu \mathrm{~mol}$ scale from resin-bound substrate. Bifunctional EBX ( $15.8 \mathrm{mg}, 27.6 \mu \mathrm{~mol}, 2$ equiv.) was weighed into the syringe reactor and dissolved in 1 mL DCM. Then DIPEA ( $9.6 \mu \mathrm{~L}, 55 \mu \mathrm{~mol}, 4$ equiv.) was added into the reactor and agitated at room temperature for 1 hour. The resin was then filtered and washed with DCM $(3 \times 3 \mathrm{~mL})$. The
procedure was repeated one more time to ensure the $N$-terminus was fully reacted. $91 \mu \mathrm{~L}$ of Ac -Cys-OMe solution ( 226 mM ) in DMF ( $20.7 \mu \mathrm{~mol}, 1.5$ equiv.), DIPEA ( $9.6 \mu \mathrm{~L}, 55 \mu \mathrm{~mol}, 4$ equiv.) and DMF ( 1.9 mL ) were added into the reactor and the mixture was agitated at room temperature without protecting from light and atmosphere for 2 hours. Following HFIP/DCM cleavage from resin and removal of volatiles, the crude peptide was purified by reverse-phase HPLC with Method 5 and lyophilized to afford peptide $\mathbf{5 h}$ as a fluffy white solid ( $4.8 \mathrm{mg}, 5.2 \mu \mathrm{~mol}, 38 \%$ yield based on the original resin loading).

Figure S82: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude and purified product 5h by Method 1.

## On resin Cys-Lys cyclization:

## Procedure:

Peptide EBX was prepared on a $20 \mu$ mol scale from resin-bound substrate. After SPPS synthesis, the Mmt protecting group was removed by treating with 1 mL of DCM/TFA/TIPS (94:1:5) for 5 times, each time for 2 min . The resin was then washed with DCM $(3 \times 3 \mathrm{~mL})$. Bifunctional EBX ( $22 \mathrm{mg}, 40 \mu \mathrm{~mol}, 2$ equiv.) was added into the syringe reactor and dissolved in 2 mL DMF. Then DIPEA ( $14 \mu \mathrm{~L}, 80 \mu \mathrm{~mol}, 4$ equiv.) was added into the reactor and the mixture was agitated at room temperature for 2 hours. The resin was then filtered and washed with DCM ( $3 \times 3 \mathrm{~mL}$ ). Resin was cleaved by using TFA/TIPS/ $\mathrm{H}_{2} \mathrm{O}(95 / 2.5 / 2.5)$ for 1 hour and the remaining solution was diluted with water and removed by lyophilization. The crude peptide was purified by reverse-phase HPLC with Method 6 and lyophilized to afford $\mathbf{1 0}$ ( $2.5 \mathrm{mg}, 3.1 \mu \mathrm{~mol}, 16 \%$ yield) (yield based on the original resin loading).

10. Procedure for one-pot S-alkynylation of peptide:

Peptide AcKLAFG ( $8.0 \mu \mathrm{~mol}, 4.6 \mathrm{mg}, 1$ equiv.) was weighed on the analytical balance and dissolved in $200 \mu \mathrm{~L}$ non-degassed DMF. Afterwards, the bifunctional EBX reagent ( $5.0 \mathrm{mg}, 8.8$ $\mu \mathrm{mol}, 1.1$ equiv.), DIPEA ( $5.7 \mu \mathrm{~L}, 32 \mu \mathrm{~mol}, 4$ equiv.) and $600 \mu \mathrm{~L}$ DMF were added into the reaction solution (concentration: 10 mM ) and it was stirred for 20 min without protecting from the atmosphere. $166 \mu \mathrm{~L}$ of a solution of Ac-Cys-OMe ( 1.1 equiv., 50 mM in DMF) and $634 \mu \mathrm{~L}$ DMF (concentration: 5 mM ) were placed into a 2 mL vial and the reaction mixture was stirred for 1 hour without protection of light or atmosphere. The desired product 5a was isolated by Prep-RP-HPLC as a white fluffy solid ( $34 \%$ yield, $2.4 \mathrm{mg}, 2.7 \mu \mathrm{~mol}$ ).

Figure S87: HPLC-UV chromatogram (210 nm) of the crude by Method 1.

## 11. Procedure for one-pot dual functionalization of peptide-EBX:

EBX of AcKLAFP 3 g ( $5 \mathrm{mg}, 5 \mu \mathrm{~mol}, 1$ equiv.) was weighed on the analytical balance and dissolved in $200 \mu \mathrm{~L}$ non-degassed DMF. Afterwards, $100 \mu \mathrm{~L}$ of a solution of Ac-Cys-OMe ( 1 equiv., 50 mM in DMF), $5 \mu \mathrm{~L} 2 \mathrm{M} \mathrm{K}_{2} \mathrm{HPO}_{4}$ (2 equiv.) in milli-Q purified water and $685 \mu \mathrm{~L}$ DMF were placed into a 2 mL vial and the reaction mixture was stirred for 1 hour without protection of light or atmosphere. Then $214 \mu \mathrm{~L}$ of $\operatorname{PhEBX}$ ( 70 mM in DMF), $60 \mu \mathrm{~L}$ of as solution of CzIPN (30 $\mathrm{mol} \%, 25 \mathrm{mM}$ in DMF) and $20 \mu \mathrm{~L} 2 \mathrm{M} \mathrm{K}_{2} \mathrm{HPO}_{4}$ (8 equiv.) in milli-Q purified water were added into the reaction mixture. The vial was then capped and degassed by bubbling with $\mathrm{N}_{2}$ for 20 min . The reaction was stirred under Blue LEDs irradiation for 30 min at RT.
At the end of the reaction, the crude was injected in RP-HPLC. The desired product $\mathbf{1 1}$ ( 2.1 mg , $2.1 \mu \mathrm{~mol}, 42 \%$ yield) was isolated by Prep-RP-HPLC with Method 5.

## 12. RuAtAC of S-alkynylation products

## RuAtAC product of FLAFP S-alkynylation product (12a)

## Procedure:

S-alkynylation product 5 g ( $3.0 \mathrm{mg}, 3.2 \mu \mathrm{~mol}$, 1.0 equiv.) was weighed on the analytical balance in an eppendorf. $50 \mu \mathrm{~L}$ of 32 mM solution of $\mathrm{Cp} * \mathrm{Ru}(\operatorname{cod}) \mathrm{Cl}(1.6 \mu \mathrm{~mol}, 50 \mathrm{~mol} \%)$ in DMF and 32 $\mu \mathrm{L}$ of 10 mM solution of (azidomethyl)benzene ( $3.2 \mu \mathrm{~mol}, 1.0$ equiv.) in DMF were added. Both solutions were prepared by using degassed DMF. Then the reaction mixture was further diluted with $118 \mu \mathrm{~L}$ DMF (concentration: 16.5 mM ). The reaction vessel was sealed with parafilm and shaken for 16 h under air. At the end of the reaction, $5 \mu \mathrm{~L}$ of the crude was diluted with $45 \mu \mathrm{~L}$ of MeCN and injected in RP-HPLC. HPLC ratio ( 210 nm ) of the product: $>95 \%$ 12a: 12a' $=12: 1$. The desired product 12a (major regioisomer) was isolated by RP-HPLC by Method 5 ( $2.1 \mathrm{mg}, 2.0$ $\mu \mathrm{mol}, 61 \%$ ) as purple fluffy solid.

## 13. Peptide macrocyclization:

## General Procedure:

Peptide-EBX ( 0.01 mmol ) were weighed on the analytical balance and dissolved in $830 \mu \mathrm{~L}$ nondegassed DMA in a 2 mL vial. Afterwards, $120 \mu \mathrm{~L}$ of CzIPN solution ( $3 \mu \mathrm{~mol}, 0.3$ equiv.) ( 25 mM in DMA), $50 \mu \mathrm{~L} 2 \mathrm{M} \mathrm{K}_{2} \mathrm{HPO}_{4}$ ( 0.10 mmol , 10 equiv.) in milli-Q purified water were added (concentration: 10 mM ). The vial was then capped and degassed by bubbling with $\mathrm{N}_{2}$ for 20 min . The reaction was stirring under Blue LEDs irradiation for 30 min at RT. The cyclic peptides were isolated by Prep-RP-HPLC, followed by lyophilization.
Common side-products that can be observed in HPLC:

### 13.1 Calibration of the cyclization reaction

Absorbance (mAU) versus concentration (mM) of the cyclic peptide Ac-KLAFP (13a)

| Conc. $(\mathrm{mM})$ | Absorbance (mAU) |
| :---: | :---: |
| 0.5 | 1261.93 |
| 1 | 2071.25 |
| 1.5 | 3535.31 |
| 2 | 6247.10 |

Figure S91: Linear equation of the absorbance (mAU) versus concentration (mM) of the cyclic peptide (Ac-KLAFP)
Table S51: Reaction optimization:

a. Solvent optimization

Using DMF as the reaction solvent resulted in more by-product for other substrates. Therefore, DMA was chosen as the optimal solvent.

Table S51: Solvent optimization.

| Solvent | Absorbance (mAU) | Yield (\%) |
| :---: | :---: | :---: |

| DMSO | 876.98 | 52 |
| :---: | :---: | :---: | :---: |
| DMF | 1192.41 | 61 |
| DMA | 369.33 | 59 |
| MeCN |  | 36 |

Table S52: Concentration optimization

| Conc. $(\mathrm{mM})$ | Absorbance (mAU) | Yield (\%) |
| :---: | :---: | :---: |
| 10 | 1111.11 | 59 |
| 2.5 | 361.30 | 36 |
| 5 | 745.87 | 48 |
| 20 | 819.92 | 50 |

Table S53: Catalyst loading and base amount optimization

| Catalyst loading <br> (mol\%) | Base <br> (equiv.) | Absorbance <br> (mAU) | Yield (\%) |
| :---: | :---: | :---: | :---: |
| 30 | 5 | 910.53 | 53 |
| 15 | 10 | 863.71 | 51 |

### 13.2 Scope of the peptide macrocyclization

HPLC UV ratio was determined by taking the ration of $A_{\text {prod }} / A_{\text {total }}$ where $A_{\text {prod }}=$ area in mAU of the product peak and $\mathrm{A}_{\text {total }}=$ area in mAU of the combined peptide containing species (product, DMA adduct, iodoalkyne). The dr of the product was determined by the HPLC UV ratio of the reaction crude.

## Cyclic peptide of Ac-KLAFP (13a)

Following the general procedure, the reaction was conducted in 0.01 mmol scale. HPLC ratio (210 nm ) of the product: > $95 \%$. The dr was not determined. The desired product $\mathbf{1 3 a}(3.2 \mathrm{mg}, 4.5 \mu \mathrm{~mol}$, $45 \%$ yield) was isolated as diastereomers (dr 1.7:1 by ${ }^{1} \mathrm{H}$ NMR of isolated product) by Method 5.

Figure S92: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude and purified product 13a by Method 1.
${ }^{1} \mathrm{H}$ NMR ( 600 MHz, DMSO-d (dr 1.7:1, only one was resolved)) $\delta 7.45$ (dd, $J=26.9,7.4 \mathrm{~Hz}$, $1 \mathrm{H}), 7.34-7.26(\mathrm{~m}, 3 \mathrm{H}), 7.25-7.19(\mathrm{~m}, 5 \mathrm{H}), 5.04(\mathrm{q}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.33(\mathrm{p}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H})$, $4.25-4.18(\mathrm{~m}, 2 \mathrm{H}), 4.19-4.12(\mathrm{~m}, 1 \mathrm{H}), 4.06(\mathrm{dd}, J=7.3,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.44$ (ddt, $J=12.6,7.5$, $3.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.22-3.15(\mathrm{~m}, 1 \mathrm{H}), 3.12-3.02(\mathrm{~m}, 1 \mathrm{H}), 3.00-2.91(\mathrm{~m}, 2 \mathrm{H}), 2.87(\mathrm{dd}, J=13.0,8.0$ $\mathrm{Hz}, 1 \mathrm{H}), 2.00(\mathrm{dd}, J=18.4,9.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.90(\mathrm{ddt}, J=9.4,6.2,3.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.82(\mathrm{~d}, J=2.7 \mathrm{~Hz}$, $3 \mathrm{H}), 1.75-1.68(\mathrm{~m}, 1 \mathrm{H}), 1.60-1.53(\mathrm{~m}, 1 \mathrm{H}), 1.49(\mathrm{dq}, J=9.8,4.7 \mathrm{~Hz}, 2 \mathrm{H}), 1.45-1.37(\mathrm{~m}, 2 \mathrm{H})$, $1.35-1.29(\mathrm{~m}, 1 \mathrm{H}), 1.22(\mathrm{q}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 1.12(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.01(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H})$, $0.85(\mathrm{dd}, J=17.5,6.3 \mathrm{~Hz}, 3 \mathrm{H}), 0.79(\mathrm{dd}, J=17.2,6.1 \mathrm{~Hz}, 3 \mathrm{H})$.

## Cyclic peptide of FLKAFP (13s)

Following the general procedure, the reaction was conducted on a $4 \mu \mathrm{~mol}$ scale. HPLC ratio (210 nm ) of the product $17 \%$. Isolation was not conducted due to the low yield.

HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude reaction mixture after 30 min by Method 1

Retention time: $\quad 12.084 \mathrm{~min} \quad$ Area Percent: $7 \%$

Figure S110: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude by Method 1.

## Cyclic peptide of FLRAFP (13t)

Following the general procedure, the reaction was conducted on a $4 \mu \mathrm{~mol}$ scale. HPLC ratio (210 nm ) of the product $14 \%$. Isolation was not conducted due to the low yield.

Retention time: $12.238 \mathrm{~min} \quad$ Area Percent: 7\%

Retention time: $12.608 \mathrm{~min} \quad$ Area Percent: $7 \%$

Figure S111: HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude by Method 1.
Cyclic peptide of GRGDFP (13u)
Following the general procedure (DMSO as the solvent), the reaction was conducted on a 0.004 mmol scale. HPLC ratio ( 210 nm ) of the product: $65 \%$ (dr 2.1:1). The desired product 13u (1.1 $\mathrm{mg}, 1.5 \mu \mathrm{~mol}, 37 \%$ yield) was isolated by Method 6.

HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude reaction mixture after 30 min by Method 2.

## Cyclic peptide of ETFLDLPALLP(13w)

Following the general procedure (DMSO as the solvent), the reaction was conducted on a 0.005 mmol scale. HPLC ratio ( 210 nm ) of the product: $85 \%$ (dr n.d.). The desired product $\mathbf{1 3 w}$ ( 2.3 mg , $1.7 \mu \mathrm{~mol}, 39 \%$ yield) was isolated by Method 6 .

Retention time: $14.607 \mathrm{~min} \quad$ Area Percent: 100\%

Figure S113: HPLC-UV chromatogram ( 210 nm ) and $\operatorname{MS}(E S I)$ of the crude and purified product 13w by Method 1.

HRMS (ESI/QTOF) m/z: $\left[\mathrm{M}+\mathrm{H}_{2}\right]^{+2}$ Calcd for $\mathrm{C}_{68} \mathrm{H}_{99} \mathrm{~N}_{11} \mathrm{O}_{16}{ }^{+2}$ 662.8630; Found 662.8631 .

## Cyclic peptide of AFPIPI (13x)

Following the general procedure, the reaction was conducted on a 0.014 mmol scale. HPLC ratio $(210 \mathrm{~nm})$ of the product: $81 \%$ (dr 13:1). The desired product 13x P2 ( $4.3 \mathrm{mg}, 5.6 \mu \mathrm{~mol}, 41 \%$ yield) was isolated by Method 6 (pure P1 could not be isolated).

HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of the crude reaction mixture after 30 min by Method 2.

HPLC-UV chromatogram ( 210 nm ) and MS(ESI) of 13x P2 by Method 2:

## Cyclic peptide of TVPIFY (13y)

Following the general procedure, the reaction was conducted in $6.0 \mu \mathrm{~mol}$ scale. After the reaction, 1 mL TFA was added into the reaction mixture to deprotect the protecting group on the peptides. The reaction mixture was then quenched with excess amount of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ until no $\mathrm{CO}_{2}$ was formed, followed by the isolation on Prep HPLC. HPLC ratio ( 210 nm ) of the product: $68 \%$ (dr 4.5:1). The desired products 13y were isolated as two separable diastereomers (P1 $0.29 \mathrm{mg}, 0.34 \mu \mathrm{~mol}, 6 \%$ yield, P2, $1.1 \mathrm{mg}, 1.3 \mu \mathrm{~mol}, 22 \%$ yield, $28 \%$ yield in total) by Method 6.

## 14. Procedure for reduction of cyclic peptides:

Lindlar catalyst ( $5 \% \mathrm{Pd}$ ) ( $3.2 \mathrm{mg}, 1.5 \mu \mathrm{~mol}, 1$ equiv. based on the loading of Pd ) was weighed in a 2 mL vial, the cyclic peptide AFPIPI 13x ( $1.2 \mathrm{mg}, 1.5 \mu \mathrm{~mol}$, 1 equiv.) was dissolved in 0.5 mL dry MeOH and added into the vial. $10 \mu \mathrm{~L}$ of quinoline ( $0.75 \mu \mathrm{~mol}, 0.5$ equiv., $7.5 \mu \mathrm{M}$ in MeOH solution) was added into the vial. Then the vial was capped and degassed by bubbling with $\mathrm{N}_{2}$ for 10 min . Then, a hydrogen balloon was connected to the flask through a needle and the mixture was vigorously stirred at room temperature for 16 h . The crude mixture was filtrated through the syringe filter and washed with MeOH . The crude material was purified by Prep-HPLC with Method 6 to afford the desired product $14(0.91 \mathrm{mg}, 1.2 \mu \mathrm{~mol}, 80 \%$ yield $)$.

## 15. TR-FRET competition assay

To establish the TR-FRET assay, N-Terminal $6 \times$ His-tagged human KEAP1 Kelch repeat domain (residues 312-624) was expressed as a tagged fusion protein in E. coli and subsequently purified via Ni-NTA resin purification, and size-exclusion chromatography. For TR-FRET, N-Terminal $6 \times$ His-tagged KEAP1 was incubated with a Europium-labeled anti- $6 \times$ His antibody (LANCE-EuW1024 Anti $6 x$ His, PerkinElmer) and a Sulfo-Cy5-N3-labeled peptide probe (sequence: Ac-Propargylglycine-Peg 2 -LDEETGEFL- $\mathrm{NH}_{2}$ ) allowing the assembly of donor and acceptor dye pairs for use in protein-binding assay.

The assay was measured by adding 2-fold dilutions of testing peptides (final concentration from 2666.7 nM to 0.17 nM ) to premixed N -Terminal $6 \times$ His-tagged KEAP1 (final concentration 20 nM ), Sulfo-Cy5-N3-labeled peptide probe (final concentration 40nM) and Europium-labeled anti$6 \times$ His antibody (final concentration 0.5 nM ) in HEPES buffer ( 10 mM HEPES, 150 mM NaCl , $0.005 \% ~(\mathrm{w} / \mathrm{v})$ Tween-20, $0.05 \% ~(\mathrm{w} / \mathrm{v}$ ) BSA, pH 7.4 ). The reagents were added to wells of a 384microwell plate (ThermoFischer NUNCTM 384 shallow well std height plates non-sterile, black) to reach a total assay volume of $15 \mu$. The plate was sealed and centrifuged at 800 g for 1 minute to eliminate bubbles in the wells. After 30 min incubation at RT, the TR-FRET signal was measured using a plate reader (PHERAstar FSX, BMG) exciting at 337 nm and measuring with a delay of $60 \mu \mathrm{~s}$ the emission at both, 620 nm (from europium) and 665 nm (from Cy5) with a measurement window of $400 \mu \mathrm{~s}$. Ratio of fluorescent emission intensity at $665-620 \mathrm{~nm}$ was calculated for each reaction (equation 1). Percent inhibition was calculated based upon Min (control compound - KI696) vs. Max (DMSO) according to equation $2 \& 3$. Sigmoidal curves were fitted to the data using Graphpad Prism 5 software.

To test the feasibility of this assay, we measured the binding affinity of the unlabeled linear peptide sequence (Ac-LDEETGEFL-NH2), and a similar affinity as reported in the literature was observed $\left(\mathrm{IC}_{50}=71 \mathrm{nM}\right.$ vs $\left.74 \mathrm{nM}^{6}\right)$.

[^5]

Figure S122: Binding affinity of peptidic macrocycles to the Keap1-Nrf2 PPIs site, measured in TR-FRET competition assays. Average values of three independent measurements are shown.

$$
\begin{gather*}
\text { Test ratio }=E m_{665} / E m_{620} * 1,0000  \tag{1}\\
\% \text { FRET activity }=\frac{\text { Test ratio-Min }(\text { control compound })}{\text { Max(DMSO) }) \text { Min (control compound })} * 100 \tag{2}
\end{gather*}
$$

$$
